PRESS RELEASE

For Immediate Release

The Black Manta, new surveillance and security drone

After the release of its larger model, the quadricopter KAYRYS, the North American start-up unveils a smaller and stealth version intended mainly for safety and monitoring.

The team of Slidx developed the Black Manta, a furtive drone which is now available for sale. It adapts perfectly to the problems of civil or defense security with **tactical laser sight, motion detector, spotlight, thermal and night vision**, as well as a **mapping tool** for sectors such as agriculture or mining.

This UAV weights **less than 5lbs**, can fly day and night and **perform autonomously and programmable missions** with real-time video feedback. It can perform missions such as, protection of sensitive sites (nuclear power stations), fast intervention for counter-terrorism or tactical support.

Finally, the **Man/Machine interface** already present on the KAYRYS will be kept on the Black Manta. An interactive screen is directly installed on the vehicle to allow live communication.
